### **DETAILED ACTION**

# Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 1-16 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

• In claims 1 and 7, "wherein the central portion is substantially devoid of nitrogen" is not supported by the disclosed specification.

### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-6 and 8-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Li et al. (US 2002/0020919) in view of Hao et al. (US 5,939,763).

With regard to claims 1-4, Li et al. disclose a diffusion barrier layer ([0020] to [0029] and fig. 2) for semiconductor devices having an upper surface and a lower surface and a central portion and comprising silicon, carbon, nitrogen, and hydrogen ([0024]). Li et al. teach the conductive material 32 should be surrounded by nitride to prevent diffusion of Cu into insulative material 40 and oxygen into Cu layer 32 ([0012] and fig. 2) and Li et al. also teach the composition of (CH<sub>3</sub>)<sub>x</sub>Si<sub>3</sub>N<sub>(4-x)</sub> within the barrier layer 100 ([0028]), but Li et al. do not disclose the nitrogen being non-uniformly distributed throughout the diffusion barrier layer 100. However, Hao et al. disclose ultra-thin dielectric layer 10, where the nitrogen concentration is elevated at the thin upper and thin lower surface regions and the nitrogen concentration is low (devoid) in the center portion of layer 10 (Hao col. 6, lines 40-67 and fig. 2a-d). Hao et al. teach the nitrogen rich region is impede impurity diffusion from the gate electrode and relax the interfacial strain between the substrate and the dielectric layer 10 (Hao col. 2, lines 25-31). Therefore, it would have been obvious to one with ordinary skill in the art to modify Li's device with the teaching of Hao et al. to include a non-uniform nitrogen distributed barrier layer with a central portion is substantially devoid of nitrogen in order to have a diffusion barrier to prevent the diffusion of impurity and relax the interfacial strain.

With regard to claim 5, Li et al., modified by Hao et al. in claim 1 above, would discloses the silicon oxynitride layer 10, which contained oxygen (Hao col. 6, lines 40-45).

With regard to claim 6, Li et al. do not disclose the carbon and silicon in the layer is in the form of silicon carbide. However, in the CVD process, the carbon and silicon, inherently, could combine and form silicon carbide.

Art Unit: 2814

Claims 7 and 11-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ngo et al. (US 6,228,761) in view of Li et al. (US 2002/0020919) and Hao et al. (US 5,939,763).

With regard to claims 7-11, Ngo et al. disclose a semiconductor device (col. 4, line 35 to col. 6, line 48 and fig. 10) comprising:

- A substrate 40 containing conductive elements;
- A diffusion barrier layer 56 applied to at least a portion of the substrate in contact with the conductive metal 58. Ngo et al. do not disclose the diffusion barrier layer 56 having an upper and a lower surfaces and a central portion comprising silicon, carbon, nitrogen, and hydrogen with nitrogen being non-uniformly distributed throughout the diffusion barrier layer 56. However, Li et al. modified by Hao et al., in claim 1 above, disclose the above-mentioned layers. Li et al. teach the silicon chemically bonded oxynitride and organic material would provide a barrier between the conductive metal and insulative material to prevent the diffusion of elements (Li [0021] and [0025]). Therefore, it would have been obvious to one with ordinary skill in the art to modify Ngo's device with the teaching of Li et al. and Hao et al. to provide the diffusion barrier layer having an upper and a lower surfaces and a central portion devoid of nitrogen. Doing so would prevent the diffusion of elements and damage the device.

With regard to claim 12, Ngo et al. disclose the conductive element is made from tungsten (col. 6, line 29).

With regard to claim 13, Ngo et al. disclose the conductive element is made from tungsten (col. 6, line 29), but do not disclose the conductive elements are made from copper.

However, Li et al. disclose copper is used in the conductive layer. Since copper is a common conductive material and is a better conductive material. Therefore, it is obvious that copper could be used in Ngo's device as a design alternative.

With regard to claims 14-15, Ngo et al. modified by Hao et al. in claim 7 above, would disclose the thickness of the ultra-thin silicon oxynitride layer 10 is about 6 nm (Hao col. 3, lines 48-60). Since the applicant has not established the criticality of the thickness stated and since the thickness is in commonly use in similar devices in the art, it would have been obvious to one of ordinary skill in the art to use these value in the device of the thickness. Where patentability is said to be based upon particular chosen dimension or upon another variable recited in a claim, the applicant must show that the chosen dimensions are critical. In re Woodruff, 919 F2d 1575, 1578, 16 USPQ2d 1934, 1936 (Fed. Cir. 1990).

With regard to claim 16, Ngo et al. do not disclose a portion of carbon and silicon is in form of silicon carbide. However, Li et al. disclose in claim 6 above that silicon carbide could be formed.

#### Response to Arguments

Applicant's arguments filed 8/28/02 have been fully considered but they are not persuasive.

 Applicant's arguments with respect to claims 1-16 have been considered but are moot in view of the new reference Hao et al. (US 5,939,763). Application/Control Number: 09/502,729 Page 6
